Profile Summary

Cloud and platform engineer building, automating and securing cloud-native infrastructure on AWS and GCP. Most of my work is container orchestration, mainly Kubernetes (EKS, GKE), along with Amazon ECS and AWS App Runner: migrating services, packaging them with Helm, delivering them with GitOps and scaling them on the right signal. Experienced in cloud cost optimization, disaster recovery and security governance, with a cybersecurity background that shapes how I build platforms: least privilege, policy as code and automated response.

Education

Thakur College of Engineering and Technology

May 2026

Bachelor of Technology in Computer Science and Engineering – Specialization: Cybersecurity

CGPA: 9.15/10.00

Technical Skills

Programming & Automation: Python (FastAPI), Bash, Terraform

Cloud & Platform Engineering: AWS, GCP, Kubernetes (EKS, GKE), Amazon ECS, AWS App Runner, Elastic Beanstalk, Docker, Helm, ArgoCD, GitHub Actions, GitOps, Infrastructure as Code, Blue-Green Deployments, Disaster Recovery

Event-Driven & Distributed Systems: KEDA, Celery, Redis, Event-Driven and Queue-Based Workloads

Observability & Reliability: Application Performance Monitoring (New Relic, CubeAPM), Infrastructure Monitoring

Linux & Networking: Linux, VPC Security, Security Groups, NACLs, Routing, Load Balancing, DNS, Network Hardening, VMware, VirtualBox

Work Experience

HeyMarvin – Remote

Jan 2026 – Present

Platform Engineer

- Migrated services from **AWS Elastic Beanstalk to Amazon EKS** with engineering teams using **GitOps**, designing reusable deployment workflows that cut onboarding time for new services and improved scalability, deployment consistency and disaster recovery readiness.
- Built a **multi-cluster EKS platform**: Terraform for the clusters, one Helm chart per service, and a hub **ArgoCD** reconciling every cluster through ApplicationSets.
- Ran CI on **self-hosted GitHub Actions runners in Kubernetes** with in-cluster build caching, making deployments **65–70% faster**.
- Integrated **KEDA-based event-driven autoscaling** for queue-based workloads, scaling Celery workers from zero on queue depth instead of CPU.
- Developed reusable **Helm chart templates** and automated CI/CD workflows with **GitHub Actions**, standardizing deployments across Kubernetes environments.
- Deployed and managed **observability and monitoring** for infrastructure and applications, improving visibility, incident detection and performance troubleshooting.

Fixerra – Remote

June 2025 – Dec 2025

DevSecOps Engineer

- Led **cloud and security operations** at a fintech startup, running containerized services on **Amazon ECS** and **AWS App Runner**.
- Achieved **56% AWS cost optimization** by restructuring compute, tightening storage lifecycles and eliminating redundant workloads identified during an infrastructure assessment.

- Built a serverless **funnel-data ETL pipeline** on **Lambda, S3, AWS Glue and Athena** running at almost zero cost.
- Supported **ISO audit certification** by strengthening cloud security posture, enforcing governance controls and ensuring compliance with organizational and regulatory standards.
- Designed and implemented **Disaster Recovery (DR) strategies** for system resilience, failover readiness and business continuity.

Flexiloans – Mumbai, IN

Nov 2024 – Mar 2025

Infosec Consultant Intern

- Led and executed **5+ cloud TPRM assessments**, identifying critical vendor risks aligned with compliance standards.
- Supported **incident response engineering** through detailed root-cause investigations and incident workflow documentation.
- Evaluated and conducted POCs for enterprise-grade **DLP solutions**, contributing to improved data protection strategies.

IIT Bombay Trust Lab – Mumbai, IN

Sept 2024 – Oct 2024

SOC Analyst Intern

- Customized and deployed **Wazuh SIEM** to ingest and correlate logs for real-time phishing detection.
- Developed actionable **security dashboards** for phishing attack visibility and alerting.
- Collaborated with academic leadership to architect an **open-source SOC lab**, integrating multiple detection and response tools.

Personal Projects

Fast Self-Hosted GitHub Runners on Kubernetes

Kubernetes, ARC, GitHub Actions, BuildKit,

Docker, Helm, kind

- Ran GitHub Actions on self-hosted **Actions Runner Controller (ARC)** runners, which keep every job in a fresh, ephemeral pod, and moved build state into the cluster to make builds fast.
- Added a long-lived remote **BuildKit** daemon on a persistent volume for Docker layer caching, and an in-cluster **Actions cache server** for npm and Next.js caches, cutting a Docker build from **231 s to 3 s** on a warm cache.
- Published it as a hands-on workshop and wrote up the silent failure modes, such as overwritten cache URLs and registry manifest errors.

Automated Serverless Incident Response on AWS

GuardDuty, EventBridge, SNS, Lambda (Python),

Terraform

- Built a serverless incident response pipeline and simulated IAM credential compromise to test automated remediation, defined as infrastructure as code.
- Achieved an average containment time of **under 10 minutes**, reducing manual triage effort.

Real-Time Cloud Security Posture Management (CSPM)

Lambda, EventBridge, SQS, MongoDB,

OPA, Terraform

- Designed a CSPM for real-time S3 security monitoring, with **Open Policy Agent** enforcing policy-as-code checks on encryption, ACLs and public access.
- Stored findings and risk assessments in MongoDB with a React and Flask dashboard, deployed through modular **Terraform** templates.

Achievements

Top 5 Finalist – Smart India Hackathon 2023

Dec 2023
